Data Governance

About the Program

This program is created in order to create semantic and ownership data governance in the organization, using the BIAN BOM Model and DAMA procedures to secure and perform the DATA strategy in the organization.

Why is different ?

BIAN have created the only semantic definition for financial sector in the market, facilitating the data entity definition and the decoupling required in any data governance strategy.

Also, together with DAMA Standards have been created the governance and ownership procedures required for future data exploitation.

Key Objectives

Semantic
Using BIAN as Financial Entity Dictionary putting a strong canonical definition in front of data strategy.

Decoupled
Having already divided in a simplified way all the data entities in any financial organization.

Governance
Adopting DAMA procedures in order to implement a complete governance and data ownership environment.

Strategy
Have a complete DATA Governance Strategy supported with BIAN & DANA for financial organizations.
